Claims 1-44 (Canceled)

- 45. (Original) An optical arrangement, comprising:
 - a light source that emits radiation,
 - a mount,

an optical element fastened in said mount,

wherein said optical element is acted on by said radiation such that a heat supply results from said radiation that lacks symmetry corresponding to the shape of said optical element, and

a connecting structure between said mount and said optical element, having a symmetry characteristic that substantially does not correspond to the shape of the optical element.

- 46. (Original) An optical arrangement, comprising:
 - a light source that emits radiation,
 - a mount,

an optical element fastened in said mount,

wherein said optical element is acted on by said radiation such that heat that results from said radiation lacks symmetry corresponding to the shape of said optical element, and

a single- or multi-part thermally conducting element arranged in operative connection with said optical element and said mount and having a form of heat transport that effects an at least partial compensation of the asymmetry of temperature distribution in said optical element.

47. (Original) A projection exposure system for microlithography, comprising:

portions.

an optical element that is heated by radiation in a manner that lacks rotational symmetry, and a cooling system for said optical element that lacks rotational symmetry, said cooling system including passive thermally conducting elements that effect cooling, in which said thermally conducting elements comprise adjustable

- 48. (Original) A projection exposure system for microlithography, comprising an optical element that is heated by radiation in a manner that lacks rotational symmetry, and at least one passive thermally conducting part arranged in thermal contact with said optical element, which part covers a portion of the cross section of said optical element which is not exposed to said radiation, and which part reduces temperature gradients in said optical element, in which said at least one passive thermally conducting part of a thermal conductor in thermal contact with said optical element comprises a plurality of different materials and in which said at least one passive thermally conducting part of a thermal conductor in thermal contact with said optical element is at least partially adjustable.
- 49. (Original) The optical arrangement according to claim 80, in which said optical element comprises a transmitting element.
- 50. (Original) The optical arrangement according to claim 49, in which said transmitting element comprises a lens.
- 51. (Original) The optical arrangement according to claim 88, in which said optical element comprises a transmitting element.

Wagner (Z)98003PUS2 Continuation of US Patent Application 09/934,817

- 52. (Original) The optical arrangement according to claim 51, in which said transmitting element comprises a lens.
- 53. (Original) The projection exposure system according to claim 48, in which said optical element comprises a transmitting element.
- 54. (Original) The projection exposure system according to claim 53, in which said transmitting element comprises a lens.
- 55. (Original) The projection exposure system according to claim 84, in which said optical element comprises a transmitting element.
- 56. (Original) The projection exposure system according to claim 55, in which said transmitting element comprises a lens.
- 57. (Original) The optical arrangement according to claim 80, in which said optical element comprises a mirror.
- 58. (Original) The optical arrangement according to claim 88, in which said optical element comprises a mirror.
- 59. (Original) The projection exposure system according to claim 48, in which said optical element comprises a mirror.
- 60. (Original) The projection exposure system according to claim 84, in which said optical element comprises a mirror.
- 61. (Original) The optical arrangement according to claim 80, having a slit-shaped image field.
- 62. (Original) The optical arrangement according to claim 88, having a slit-shaped image field.
- 63. (Original) The projection exposure system according to claim 48, having a slit-

shaped image field.

- 64. (Original) The projection exposure system according to claim 84, having a slitshaped image field.
- 65. (Original) The optical arrangement according to claim 80, in which said optical element is arranged near a field plane.
- 66. (Original) The optical arrangement according to claim 65, in which said optical element is arranged near a field plane.
- 67. (Original) The projection exposure system according to claim 48, in which said optical element is arranged near a field plane.
- 68. (Original) The projection exposure system according to claim 84, in which said optical element is arranged near a field plane.
- 69. (Original) The optical arrangement according to claim 80, further comprising a reticle, the illumination of which lacks rotational symmetry.
- 70. Original) The optical arrangement according to claim 69, in which said reticle illumination consists of off-axis, dipole or quadrupole illumination.
- 71. (Original) The optical arrangement according to claim 88, further comprising a reticle, the illumination of which lacks rotational symmetry.
- 72. (Original) The optical arrangement according to claim 71, in which said reticle illumination consists of off-axis, dipole or quadrupole illumination type.
- 73. (Original) The projection exposure system according claim 48, further comprising a reticle, the illumination of which lacks rotational symmetry.
- 74. (Original) The projection exposure system according to claim 73, in which said reticle illumination consists of off-axis, dipole or quadrupole illumination type.

Wagner (Z)98003PUS2 Continuation of US Patent Application 09/934,817

- 75. (Original) The projection exposure system according to claim 48, in which said optical element is arranged near a pupil plane.
- 76. (Original) The projection exposure system according to claim 84, further comprising a reticle, the illumination of which lacks rotational symmetry.
- 77. (Original) The projection exposure system according to claim 76, in which said reticle illumination consists of off-axis, dipole or quadrupole illumination type.
- 78. (Original) The projection exposure system according to claim 84, in which said optical element is arranged near a pupil plane.
- 79. (Original) The optical arrangement according to claim 88, in which said connecting structure comprises portions of different materials.
- 80. (Original) An optical arrangement comprising:
 - a light source that emits radiation.
 - a mount,

an optical element fastened to said mount,

wherein said optical element is acted on by said radiation such that heat that results from said radiation lacks symmetry corresponding to the shape of said optical element, and

a single- or multi-part passive thermally conducting element arranged in operative connection with said optical element and said mount and having a form of heat transport that effects an at least partial compensation of the asymmetry of temperature distribution in said optical element,

wherein said passive thermally conducting element comprises an assembly of portions of different material.

Wagner (Z)98003PUS2 Continuation of US Patent Application 09/934,817

material.

- 81. (Original) The optical arrangement according to claim 80, in which said connecting structure comprises adjustable portions.
- 82. (Original) The optical arrangement according to claim 84, in which said thermally conducting element is adjustable.
- 83. (Original) The projection exposure system according to claim 84, in which said thermally conducting elements comprise adjustable portions.
- 84. (Original) A projection exposure system comprising:

 an optical element that is heated by radiation in a manner that lacks rotational symmetry, and
 a cooling system for said optical element that lacks rotational symmetry, said cooling system including passive thermally conducting devices that effect cooling,
 wherein said passive thermally conducting devices comprise portions of different
- 85. (Original) A reflective mirror for use in an optical system, the mirror comprising a mirror body defining a mirror surface,
 an illuminated region of the mirror surface, and
 at least one thermally conducting element attached to the mirror outside the illuminated region, the thermally conducting element having flexibility and forming a heat conducting connection away from the mirror.
- 86. (Original) The reflective mirror according to claim 85, wherein the thermally conducting element has a cable like or longitudinally extended configuration.

Wagner

Continuation of US Patent Application 09/934,817

- 87. (Original) The reflective mirror according to claim 85, wherein the mirror body has a shape, and the at least one thermally conducting element has a symmetry characteristic that does not correspond to said shape.
- 88. (Original) An optical arrangement, comprising
 a mount,
 an optical element fastened in the mount,
 an additional flexible thermal conductor at said optical element.
- 89. (Original) An optical arrangement according to claim 88, wherein said optical element is selected from a group consisting of mirrors, lenses, prisms and transmitting elements.
- 90. (Original) An optical arrangement according to claim 80, wherein said optical element is selected from a group consisting of mirrors, lenses, prisms and transmitting elements.

BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

□ BLACK BORDERS
□ IMAGE CUT OFF AT TOP, BOTTOM OR SIDES
□ FADED TEXT OR DRAWING
□ BLURRED OR ILLEGIBLE TEXT OR DRAWING
□ SKEWED/SLANTED IMAGES
□ COLOR OR BLACK AND WHITE PHOTOGRAPHS
□ GRAY SCALE DOCUMENTS
□ LINES OR MARKS ON ORIGINAL DOCUMENT
□ REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY

IMAGES ARE BEST AVAILABLE COPY.
